Introduction

Factors that may contribute to approach-and-landing accidents include flight over hilly terrain, reduced visibility, visual illusions, adverse winds, contaminated runways and/or limited approach aids.

Flight crews should be aware of the compounding nature of these hazards during approach and landing.

Statistical data

Approach-and-landing is the most hazardous phase of any flight, as illustrated by the following data:

- Over the past 40 years, approach-and-landing accidents accounted for 55 % of total hull losses.
  
  This statistic does not show a downward trend.

- The flight segment from the outer marker to the runway threshold averages only 4 % of flight time, but accounts for 45 % of hull losses.

Table 1, Table 2 and Table 3 illustrate the respective contributions of the factors involved in:

- All approach-and-landing accidents;
- CFIT events; and,
- Runway excursions and overruns.

## Awareness Program Outline

A company awareness program on approach-and-landing hazards should review and discuss the following factors that may contribute to approach-and-landing accidents.

When preparing and briefing an approach, these factors may be either:

- Known from the crew (by means of NOTAMs, dispatcher’s briefing, ATIS, etc) and, thus, may be briefed and accounted for; or,
- Unknown and, thus, be discovered as the approach-and-landing progresses

### Aircraft Equipment

- Use (or absence) of the following safety-enhancing equipment:
  - GPWS;
  - TAWS;
  - TCAS;
  - Wind shear warning and guidance; and/or,
  - Predictive windshear system.

### Flight Crew

- Fatigue – reduced awareness:
  - Long duty time:
    - Long-haul operation; or,
    - Short-haul or medium-haul / multiple-legs operation;
  - Unfamiliar airport; and/or,
  - Unfamiliar instrument or visual approach procedure.

### Expected Approach

- Step-down non-precision approach or circling approach with no VASI / PAPI;
- Visual approach in darkness; and/or,
- Anticipated last-minute runway change.

### Approach Charts

- Absence of a published STAR;
- Missed-approach possible conflict with takeoff on intersecting runways; and/or,
- Incorrect or missing information.

### Airport Information Services

- Inaccurate TAF information;
- Absence of current weather reports;
- Absence of VOLMET;
- Absence of ATIS (or of English version of ATIS message); and/or,
- Inaccurate or outdated ATIS information (absence of regular ATIS update, when required).

### Airport Air Traffic Control Services

- Absence or primary and/or secondary surveillance radar;
- Inadequate or ineffective radar vectoring practices;

</table>
• Inadequate or non-standard air traffic control procedures;
• Inadequate air traffic flow management;
• Mixing of IFR and VFR traffics;
• Frequent uncontrolled VFR traffics in airport vicinity;
• Frequency congestion / controller overload caused by high density traffic or by a single controller operating tower and ground frequencies;
• Absence of adequate VHF coverage in known FIR or TMA sectors;
• Inadequate coordination between international and domestic FIRs;
• Absence of or failure to use landline communications between two close airports; and/or,
• Absence of English language proficiency in ATC communications and/or use of non-standard phraseology.

**Airport Equipment**
- Absence of / limited / low intensity approach and runway lighting (or part of it);
- Non-standard runway-edge lights spacing;
- Absence of ILS;
- ILS unusable beyond a specific point (because of obstacles) or below a specific altitude (because of approach over water);
- ILS without OM;
- ILS without VASI/PAPI to support the visual segment;
- Offset VOR/DME approach;
- VOR/DME with inoperative DME;
- VOR incorrect calibration;
- NDB known as unreliable in adverse weather conditions;
- Non-precision or circling approach with absence of VASI / PAPI;
- VASI/PAPI being incorrectly calibrated or inoperative;

• Unsecured airport (i.e., absence of airport perimeter fences, allowing vehicles, persons or animals to access to runway or maneuvering areas);
• No illumination of wind sock or wind “T”; and/or,
• Faded painting of runway and/or taxiways markings.

**Terrain**
- Trees or man-made obstacles (antennas, ...) penetrating the obstacle clearance level;
- Topographical features requiring unusual procedures and reduced safety margins; and/or,
- Terrain features resulting in GPWS activation during approach.

Refer to Briefing Note 5.2 - Terrain Awareness for expanded information.

**Visual Illusions**
- Airport environment (black hole, ...);
- Runway environment; and/or,
- Weather conditions.

Refer to Briefing Note 5.3 - Visual Illusions Awareness for expanded information.

**Visibility**
- Darkness, low visibility (rain, fog, mist, haze, low lighting, smoke).

**Wind conditions**
- Shifting or gusty wind, crosswind or tail wind; and/or,
- Known frequent wind shear on final approach of specific runway under adverse weather and / or wind conditions.

Refer to Briefing Note 5.4 - Wind Shear Awareness for expanded information.
Runway condition

- Wet, but known as slippery-when-wet;
- Contaminated with standing water, slush, snow or ice;
- Heavy rubber deposit in touchdown zone;
- Reduced braking action;
- Insufficient water drainage or runway surface condition leaving water puddles after rain; and/or,
- Undulated surface in touchdown zone area.

Taxiways

- Absence of high-speed-exit taxiways;
- Absence of parallel taxiway, thus requiring backtrack on the active runway; and/or,
- Non-standard taxiway marking and/or non-standard signs.

Low temperature operation

- Absence of a defined OAT threshold below which, a temperature correction on published altitudes is required.

Bird Strike Hazard

- Permanent or seasonal bird activity, without available bird control program and squad.

Decision-making and Countermeasures

A company awareness program on approach-and-landing hazards should stress the following elements of effective crew coordination and decision-making:

- Comply with standard operating procedures (SOPs), published limitations, specific operational recommendations and flying techniques;
- Adjust and use the approach and go-around briefings to heighten the flight crew awareness of the specific hazards of the approach; and,
- Anticipate and be prepared for the worst case (i.e., “expecting the unexpected” by adopting a “What if?” attitude);

Prepare options to counter approach-and-landing hazards, for example:

- Request a precision approach into the wind, whenever available;
- Define next targets and an approach gate that must be met for the approach to be continued;
- Wait for better conditions (fuel permitting); or,
- Divert to an airport with better weather conditions, wind conditions and/or runway conditions.
Associated Briefing Notes

Dedicated Briefing Notes provide specific and expanded information on the following approach hazards:

- **5.2 - Terrain Awareness**,  
- **5.3 - Visual Illusions Awareness**,  
- **5.4 - Windshear Awareness**,  
- **6.1 - Being Prepared to Go-around**,  
- **6.3 - Terrain Avoidance (Pullup) Maneuver**.

Associated Documents

The following documents published by the Flight Safety Foundation should be considered also when developing a company awareness program on approach-and-landing hazards:

- **Approach and Landing Risk Awareness Tool/Checklist**; and,
- **Approach and Landing Risk Reduction Planning Guide**.
